WORKPLACE NINJAS

Getting Started with Microsoft Purview: Data Protection and Labeling Best Practices

Kasper Nørregaard

IT & Security Consultant @ Globeteam

25+ years with Microsoft technologies

365security.dk

/in/nørregaard

Agenda

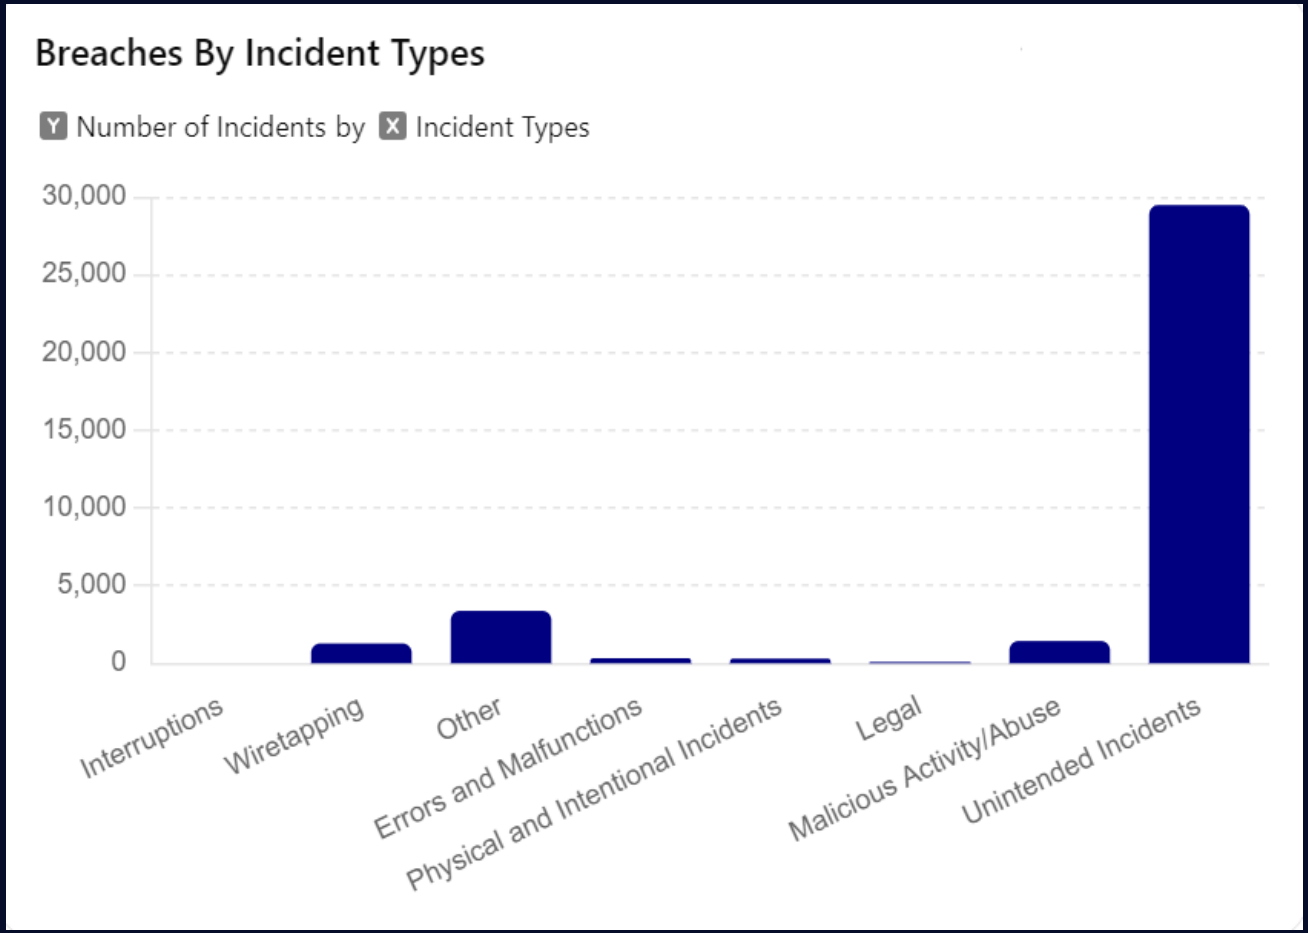
- Why data protection feels hard (and doesn't have to)
- What you'll get from this session
- Sensitivity labels where to start (and what not to do)
- "We want Copilot, are we ready?"
- Policies, Policy Tips & user awareness
- Policy Tips in action
- Crawl → Walk → Run approach
- Key takeaways & Q&A

What You'll Get From These 45 Minutes

- Know where to start with Microsoft Purview
- Understand how to classify and protect data
- Avoid common mistakes that slow adoption
- See how Policy Tips influence user behavior
- Leave with a realistic and actionable roadmap

Microsoft Purview: Why is it important

Incidents from 2018-2025 (Denmark)



- Interruptions: 1
- Wiretapping: 1280
- Other: 3377
- Errors and Malfunctions: 338
- Physical and Intentional Incidents: 302
- Legal: 87
- Malicious Activity/Abuse: 1437
- Unintended Incidents: 29505

Microsoft Purview: Data Protection

Why Data Protection Feels Hard

- “We don’t know what data we have”
- “We created too many labels”
- “Users don’t understand the labels”
- “Security blocks, users bypass”
- Do we have to talk to people outside of IT?”
- “We enabled DLP… then turned it off again”

The Foundation: Classification First

Everything in Purview starts with classification

- You can’t protect what you can’t identify.
- Classification answers one question:
  What kind of data is this?

Examples:
- Personal data
- Financial data
- Health data
- Intellectual property
- Public information

Labels, policies and Copilot all depend on this layer.

Data Classification

Information

Can be viewed by the public → Yes

- www.Globeteam.com
- Press releases

No

Can be viewed by relevant employees → Yes

- Information on the Intranet
- Employee Handbook
- Wikis
- Business Processes
- Mail
- Team Chat/Documents
- Management Notifications
- Meeting Minutes

No

Contains personal data → Yes

- All personal data about members
- Correspondence with members
- Declarations on assessors, medical consultants, etc.
- Correspondence with suppliers
- HR data

No

Can be viewed by selected employees → Yes

- Supplier Contracts
- Board Documents, etc.
- Confidential Business Documents (e.g., Network Diagrams, Passwords, Data Breaches/Incidents, Vulnerabilities, etc.)

Label	Read-Access	Print	E-mail	Logical handling/storage	Physical Handling/Storage	Destruction
"Public"	All within and outside the organization	No requirements	No requirements	No requirements	No requirements	No requirements
"Internal Use"	Work-related need for both internal and external	Use confidential print/follow-me at the workplace	Encrypted	Encrypted • Send links (without possibility for download/forwarding) to e.g., new employees • DLP (To catch mass download to USB/upload tocloud)	No requirements at the office, private and secure areas outside the office	Paper bin (for shredding) Regular deletion
"Confidential"	Work-related need for both internal and external	Use confidential print/follow-me at the workplace	Encrypted/Secure mail Can be forwared for Work-related tasks	Encrypted, Globeteam devices MUST be used (external excluded))	Private and secure areas	Paper bin (for shredding), purging/crypto-shredding/physical destruction
"Secret"	Work-related need for both internal and external	Use confidential print/follow-me at the workplace	Encrypted/Secure mail Must not be forwarded	Encrypted Encrypted, Globeteam devices MUST be used	Private and secure areas	Paper bin (for shredding), purging/crypto-shredding/physical destruction

Sensitivity Labels

Keep It Simple

Best practices for labels:

- Start with 3–4 labels
- Use language users understand
- Focus on business impact, not technical detail

Example structure:

- Public
- Internal use
- Confidential
- Secret

If users need a manual, the design failed.

Sensitivity Labels

Keep It Simple

Public

Can be freely shared with external parties.
For public use.
No visual markings.

Internal Use

Can be shared across the organization.
For internal use.
No visual markings.

Confidential

Can be shared as needed.
Visual markings could include watermark, header, and footer.

Secret

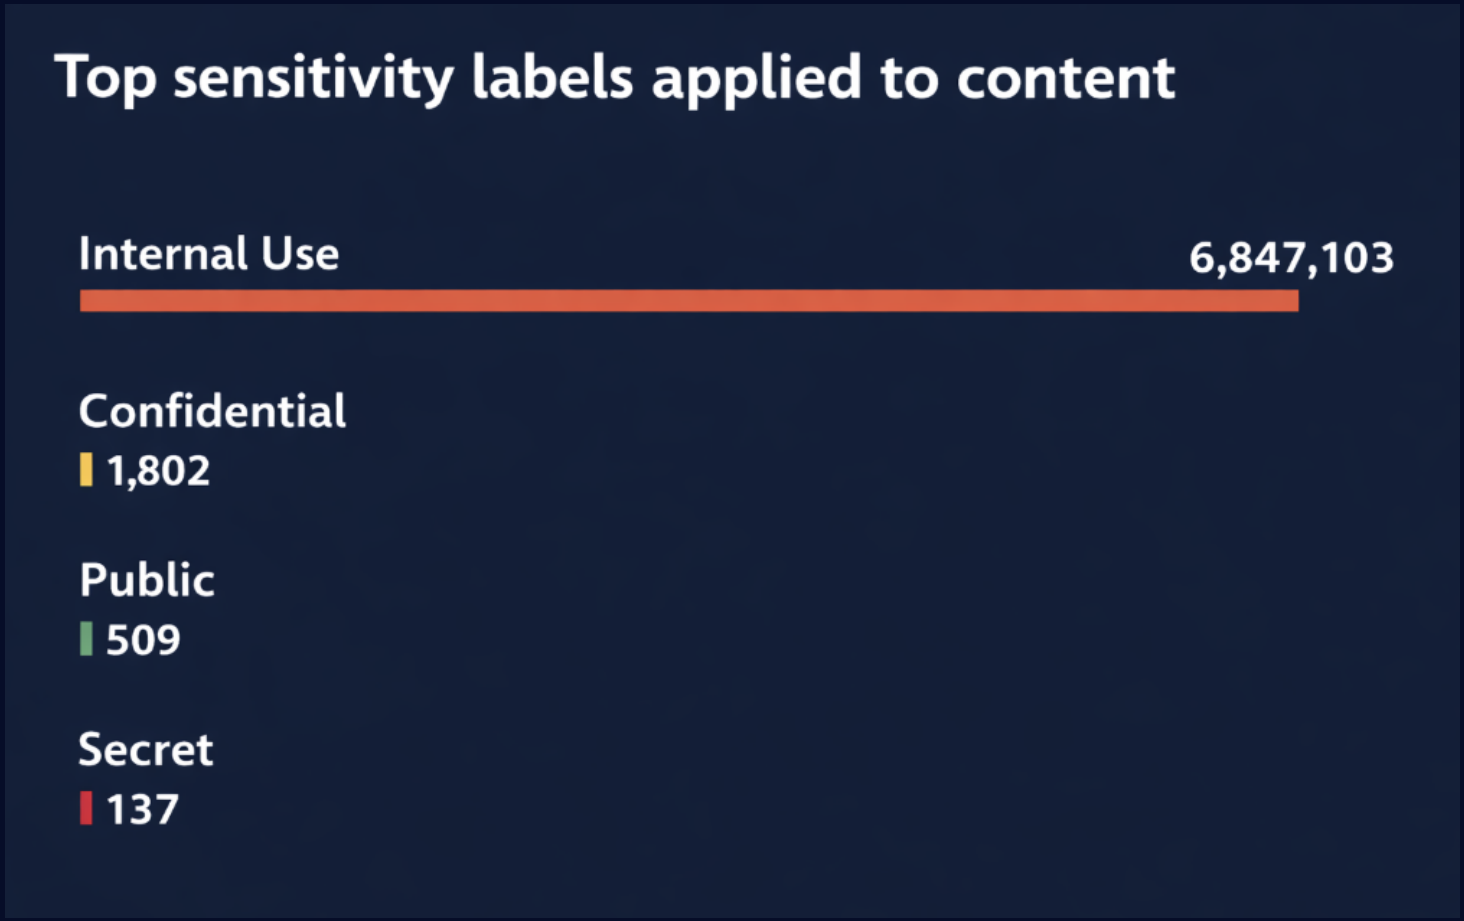
Critical data for the organization.
Only shared with named recipients.
Cannot be printed or downloaded.

Don’t Auto-Label Everything as "Internal“

What happens

- Everything looks the same
- No incentive to reclassify
- Users stop thinking about data
- Sensitive data stays mislabeled
- Reality
  If everything is *Internal*…
  nothing gets properly classified
- Better approach
  Auto-label only specific sensitive content
  not everything.

One Label to rule them all



Internal Use: 99% of all labeled content

Don’t Start With Restrictions

Common mistake

- Adding restrictions too early (encryption, access control, blocking)

What happens

- Users get blocked
- Collaboration breaks
- External partners locked out
- IT gets flooded with tickets

Sharing collapses

Next step: Let's break sharing

Restrict *Internal* to
Authenticated Users Only

What happens
- Files that used to work… stop working
- External sharing suddenly breaks
- Guests lose access
- Business workflows fail

We Want Copilot

Are We Ready?

Typical conversation:

- Management: “We want Copilot enabled now”
  Security: “What about our data?”
  IT: “Do we know what Copilot can see?”
  Everyone: “…so when can we go live?”

Reality check:

- Copilot uses existing permissions
- Copilot does not bypass security
- Copilot is only as safe as your data foundation
- Copilot doesn’t leak data unclear data protection does

We Want Copilot

Are We Ready?

Document contains **sensitive merger information**

Auto-label as **Mergers and acquisitions**

Detect when content contains sensitive data and auto-apply protections

Copilot, please summarize **Merger document.docx**

Here is the summary of your document…

Copilot, create a new document with this summary

Copilot response and Copilot created documents inherit sensitivity labels and protections

Admin creates policy to prevent Copilot access for files labeled as **Mergers and acquisitions**

Copilot, please summarize **Merger document.docx**

This document is currently protected, so I can't provide details about its content

Optionally, block Copilot access to sensitive files

Protect files even if they are moved or downloaded

Why Purview Comes Before Copilot

If possible ☺

- Copilot readiness is a data problem, not an AI problem.

Without Purview:

- Sensitive data can appear in the wrong context
- Users get no guidance
- Security lacks visibility and control over data shared with AI
- Trust in Copilot disappears fast

CISA Chief Accidentally Uploaded Sensitive Documents to Public ChatGPT Session

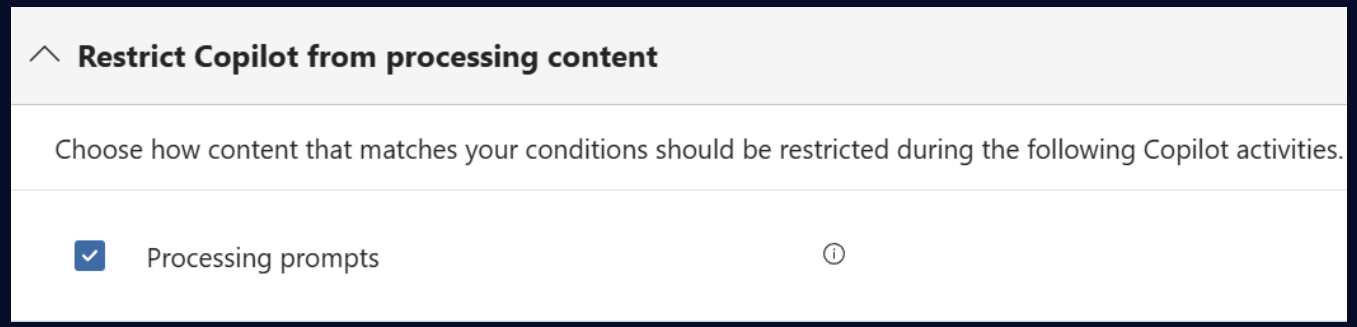
We Want Copilot

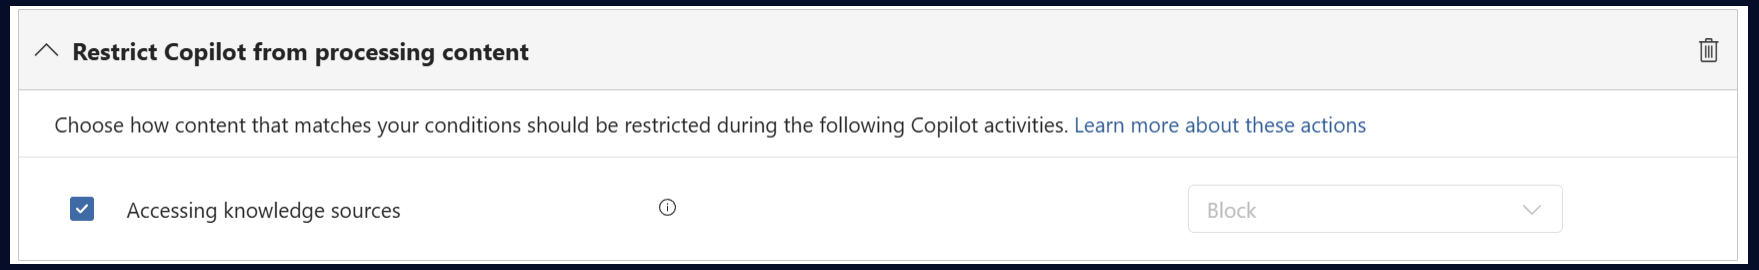
Are We Ready?

Best place to start:

1. Start using labels
2. Create DLP policies for Copilot

Sensitive information types / Labels





Policy Tips:

- Security at the Moment of Action
  - Why Policy Tips matter:
  - Warn users before data leaves
  - Educate instead of block
  - Build awareness over time

Example:

- “You are about to share content containing a Social Security Number.”

Policy Tips in Action

- Simple DLP policy
- Policy Tip triggered
- What the user sees
- Why this works

Policy Tips:

Policy tip: It looks like you're about to share content containing a Social Security Number. Remember to share this type of information securely Hide details

Kasper Nørregaard: Please verify the recipient(s) and the content, as it conflicts with the organization policy. Remove recipient

To send this message without removing the information, you must first select Override. Override

Custom Sensitive Information Types

Use custom types when:

- Data is country-specific
  - Identifiers are business-specific
  - Precision matters more than volume

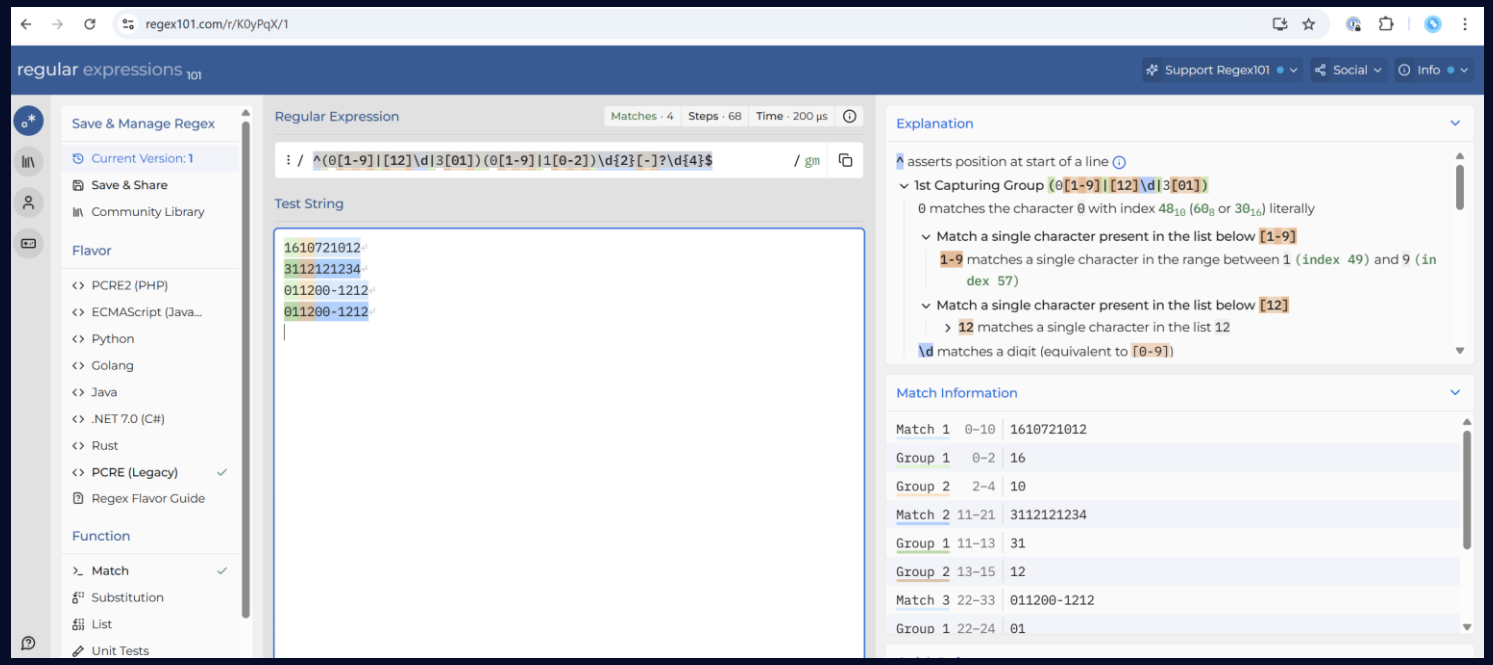
Building blocks:

- Keywords
  - Patterns
  - Regular expressions

Custom Sensitive Information Types

- Regex: (Danish CPR)

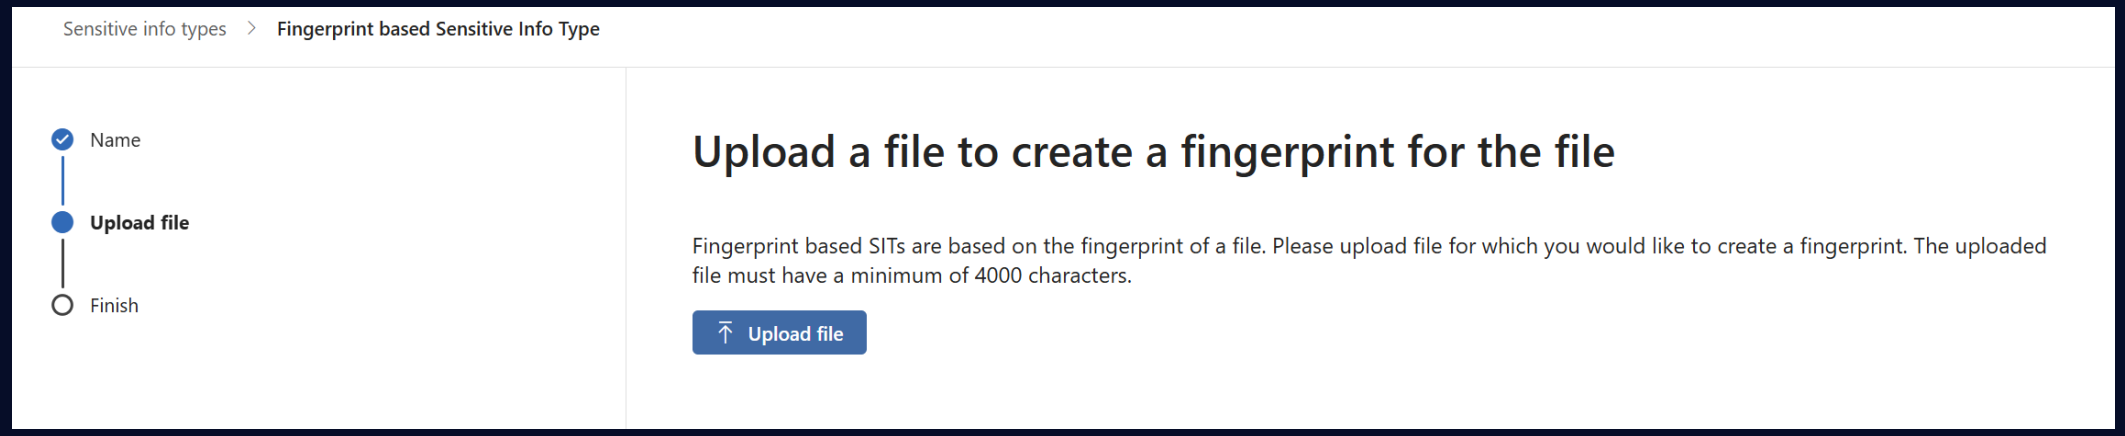
^(0[1-9]|[12]\d|3[01])(0[1-9]|1[0-2])\d{2}[-]?\d{4}$



https://regex101.com/

Custom Sensitive Information Types

- SIT Fingerprint



Crawl → Walk → Run

Crawl

- Manual labels
- DLP
- Policy Tips
- Limited scope

Walk

- Targeted auto-labeling(*)
- Stronger enforcement

Run

- Broad automation
- Advanced governance

Your First 5 Actions

- 1. Identify
  Top 3 critical data types
- 2. Create
  1–2 clear sensitivity labels
- 3. Enable
  Policy Tips
- 4. Start Simple
  Crawl → Walk → Run
- 5. Align
  IT, Security & Compliance and communicate

Key Takeaways

- Start small and intentional
- Design labels for people, not admins
- Use Policy Tips early

- Implement DLP
- Prepare your data before Copilot (this might not be possible)
- Treat Purview as a journey, not a checkbox

Q&A
