

Mac Management with Intune

Platform SSO and Passwordless Authentication

Simon Hartmann Eriksen

Consultant & Endpoint Lead @ Globeteam

Focus Areas

- Zero Trust endpoint strategies
- Enterprise macOS deployments
- Cross-platform endpoint management

Why Mac is Ready for IT

Apple silicon secure by design

Hardware and chip-level
security built in.

Software Update Management

Keep devices secure
and up to date.

Zero trust principles

Endpoint Security framework

Built-in protections.
Enterprise-grade security.

Identity integrations for single-sign On

Seamless, secure access
with SSO and identity
integrations.

Zero-touch deployment

Automated, scalable
deployments from day one.

Where Built-in Security Falls Short

SECURE BY DESIGN

- Secure Enclave
- SIP (System Integrity Protection)
- Gatekeeper
- FileVault
- Sandboxing
- XProtect

CONTINUOUS PROTECTION

- Automatic updates
- Built-in malware protections
- Notarization

PRIVACY FOCUSED

- App permissions
- Data protection
- On-device processing

1. UNRESTRICTED ADMIN ACCESS
Users can elevate privileges and make system changes.
Risk: Malware, misconfiguration, accidental or malicious changes.

2. UNMANAGED BROWSER EXTENSIONS
Users can install extensions that exfiltrate data or inject malicious code.
Risk: Credential theft, tracking, data leakage.

3. LOCAL ADMIN PROMPTS
Users can approve changes that weaken security or install risky software.
Risk: Bypass security controls and policies.

4. UNMANAGED APPS
Users can download and run unapproved apps outside IT visibility.
Risk: Malware, data loss, license & compliance issues.

5. DISABLED FILEVAULT
If the Mac is lost or stolen, data can be accessed.
Risk: Data exposure and compliance violations.

FileVault
FileVault secures the data on your disk by encrypting its content automatically. FileVault is Off Turn On...

Privacy & Security
Enter an administrator's name and password to disable FileVault.
Username: Password: Cancel Unlock

Extensions
Unknown Extension
Can read and change all your data on websites
Manage Extensions

Applications
Visual Studio Code Google Chrome Telegram Unknown App

Why Intune Matters for macOS

- Compliance enforcement
- Conditional Access
- Identity integration
- Secure onboarding
- Policy consistency
- Zero Trust
- App deploy
- DDM Policy Support
 - Patch management
- Included in your M365 E3/E5 🤖

PSSO + Passwordless: The Technology

PSSO + Passwordless: The Enterprise Reality

✓ Benefit

Fewer passwords

Reduced phishing exposure

Faster, identity-driven onboarding

Seamless SaaS access

⚠ Enterprise Reality

Recovery strategy still matters

Legacy apps may still require passwords

Users need passkey awareness

Shared/admin workflows need redesign

Authentication method for Platform SSO

 Feature	 Secure Enclave	 Smart Card	 Password
 Passwordless (phishing resistant)			
 TouchID supported for unlock			
 Can be used as passkey			
 MFA mandatory for setup			
 Local Mac password synced with Entra ID			
 Optionally, allow new users to log in with Entra ID			

Security Baseline for macOS

Hardening Strategy
Balance Security vs Usability

The “Must Have” Controls

- FileVault enforced
- Standard user accounts
- Defender for Endpoint w. EDR visibility
- Platform SSO
- Compliance policies
- Block unmanaged profiles
- Browser extension governance
- Automatic patching
- Conditional Access

Common macOS Adoption Mistakes

Common Mistakes

- Treat Macs like Windows PCs
- Permanent local admin rights
- No identity integration
- No baseline strategy
- Ignoring support readiness

My Advice

- Use macOS-native workflows
- Controlled privilege elevation
- Platform SSO + Conditional Access
- Standardized security baselines
- Support training & documentation

Community Tools

Onboarding / Migration

- ABM Migration
- Octory
- macOS ESP

App deployment

- IntuneBrew
- Brewpkg
- Packagebuilder
- Installomator

Config & Monitoring

- IntuneLogReader
- IntuneMacODC
- iMazing
- Mac Mate
- ABM/ASM API Client
- Fleetly iOS app

Security

- mSCP
- MacBeacon
- Enterprise Privileges
